Official Google Classroom Help Center where you can find tips and tutorials on using Google Classroom and other answers to frequently asked questions This article is for students. Teachers go here

If you're new to Classroom this article will show you around and help you complete common tasks Change your role Join a class with a class code in Google Classroom Join a class in Google Classroom with an email invite Join a class with a class link in Google Classroom Troubleshooting for students How do I sign out from Google Classroom? Sign in to multiple accounts at once Google Classroom Help Community Give feedback about this article Trouble joining a class? I forgot or lost the class code To join a class you just need to enter the class code once

After you join you don't need to enter the code again. If you forget, lose, or delete the code before you join the class, ask your teacher to share it with you. A class is a blueprint which you use to create objects. An object is an instance of a class, it's a concrete thing that you made using a specific class.

So object and instance are the same thing, but the word instance indicates the relationship of an object to its class. This is easy to understand if you look at an example. For example, suppose you have a class `House`

Your own house Jun 11 2015 25 The `class` is a special keyword which is provided by PHP to get the fully qualified class name

See the official PHP documentation about `class`. A good use of `static` in defining one-off utility and/or library classes where instantiation would not make sense. A great example is the `Math` class that contains some mathematical constants such as `PI` and `E` and simply provides mathematical calculations.

Requiring instantiation in such a case would be unnecessary and confusing. However, what stumps me is the usage of `Class<>`. The Java class `Class` is supposed to also take a template name or so I'm being told by the yellow underline in Eclipse. I don't understand what I should put in there.

The whole point of the `Class` object is when you don't fully have the information about an object for reflection and such. For naming template parameters, `typename` and `class` are equivalent. 14.1.2 There is no semantic difference between `class` and `typename` in a template parameter.

`typename` however is possible in another context when using templates to hint at the compiler that you are referring to a dependent type.

14.6.2 A name used in a template declaration or definition and that is dependent on a 48 3 ways to add a class to a DOM element in JavaScript There are multiple ways of doing this. I will show you three ways to add classes and clarify some
