I haveapiece of code here that is supposed to return the least common element ina listof elements ordered by commonality def getSingle arr from collections import Counter c = Counte The first [ ] is creatingaslice normally often used for getting just part ofa list which happens to contain the entirelist and thus is effectivelyacopy of thelist

The second list is using the actuallisttype constructor to createanewlistwhich has contents equal to the firstlist Nov 2 2010 When reading listisareference to the originallist andlist[ ] shallow copies thelist

When assigning list re binds the name andlist[ ] slice assigns replacing what was previously in thelist. Also don t uselistasaname since it shadows the built in The first way works fora listorastring the second way only works fora list because slice assignment isn t allowed for strings

Other than that I think the only difference is speed it looks like it salittle faster the first way. Try it yourself with timeit.timeit or preferably timeit.repeat The notationList<?> means a listof something but I m not saying what

Since the code in test works for any kind of object in thelist this works asaformal method parameter. Usingatype parameter like in your point 3 requires that the type parameter be declared. The Java syntax for that is to put <T> in front of the function

This is exactly analogous to declaring formal parameter Oct 5 2017 Sandy Chapman List.of does return some ImmutableList type its actual name is justanon public implementation detail

If it was public and someone cast it toListagain where was the difference? Where is the difference to Arrays.asList which returnsanon publicListimplementation that throws an exception when attempting add or remove or thelistreturned by Collections Jan 12 2009 A Listuses an internal array to handle its data and automatically resizes the array when adding more elements to theListthan its current capacity which makes it more easy to use than an array where you need to know the capacity beforehand Nov 29 2016 List<Customer> Object list you must be sure that at runtime thelistcontains nothing but Customer objects

Critics say that such casting indicates something wrong with your code you should be able to tweak your type declarations to avoid it. But Java generics is too complicated and it is not perfect

Sometimes you just don t know if there isapretty solution to satisfy the compiler Learn how to properly create nested HTML lists with examples and best practices as discussed on Stack Overflow Awork around is createacustom_listtype
