Mar 4 2019 You must not put the parameter placeholders inside a quoted SQL string literals in your query. Parameters are an alternative to using string literals. I would write the query like this I am using a jQuery placeholder plugin https github danielstocks jQuery Placeholder

I need to change the placeholder text with the change in dropdown menu Apr 2 2018 4 I have a query that is passing the current year as a placeholder parameter that right now is hard coded

How can I have this just pass the current year? I ve seen a few different potential solutions but most of them are in HANA Studio or involve dynamic SQL generation

I m putting the SQL into Tableau so those are both off the table Apr 29 2019 I just provide one value at run time and based on that value the query will fetch me the results using LIKE operator. My query is shown below I have used placeholder ? since my query is dynamic type

Is it possible to use placeholder in LIKE operator or does it only work with static type query? Oct 4 2021 How to use placeholders in like clause in SQL query? Asked 4 years 2 months ago Modified 4 years 1 month ago Viewed 1k times Jul 6 2010 To generate a query I need to pass an array of tags essentially primary keys but these have to be inserted as strings

As this will be a modular query and used for multiple tags a placeholder is being used. The query relies upon the use of the WHERE IN statement which is where the placeholder is like below In SQL the placeholder search is done via LIKE and the placeholder character is % not *

To mimic the ABAP behaviour when using calculation views the input parameters must be used in filter expressions in the calculation view

And these filter expressions have to check for whether the input parameter value is * or not Jun 18 2025 This means the query is in a hard loading state with no placeholder data on initial mount

Then when the queryKey changes it goes into a soft loading state placeholder data shown isPlaceholderData=true and isLoading=false Dec 15 2021 This works fine but it also adds the description text in the textbox placeholder I saw that the placeholder can be changed if the generated JSON has an example value for the query parameter

How do I add the example value or change the placeholder in general using the XML comments or something similar? Jan 1 2020 1 can I place a sql query in a sql hana place holder? the following query works.
