1 day ago TheCityofCalgary is onsite responding to a water main break east of the Sarcee Trail 16 Ave N.W. interchange. At this point it's too early to confirm the cause or the extent of the impacts. The feeder main experienced a break on June 5 2024.

Since then 29 pipe segment repairs have taken place to support the stabilization of the feeder main and the pipe has undergone an investigation to gain an understanding of the conditions that lead to the failure. No water main breaks happen.

We maintain nearly 15 000 kilometres of underground water infrastructure as part of our drinking water, wastewater and stormwater systems and have one of the lowest numbers of average breaks per 100 kilometres when compared to other major Canadian cities. TheCityofCalgary experienced a catastrophic break on the Bearspaw South Feeder Main on June 5 2024.

This feeder main is the largest in Calgary's network and distributes a significant portion of the city's treated water supply. As of September 22, 2024, TheCityofCalgary has rescinded Stage 4 water restrictions effective immediately. The feeder main has been filled, water quality tested and we have successfully reconnected the main to the rest of the water distribution system. On August 7, 2024, July 18, Outdoor Water Restrictions moved to Stage 2. Today we achieved another major milestone in the recovery from the Bearspaw South Feeder Main break by moving from Stage 3 to Stage 2 Outdoor Water Restrictions on September 18, 2024. This time, once repairs are complete and the feeder main is fully back in service, we can lift all water restrictions.

However, we will ask that Calgarians ease back into their regular water use indoors by doing things like spreading out your laundry so as not to overload the system. On June 19, 2024, in early June while repairs were being completed to the initial break on the feeder main, TheCity used a robotic device to scan approximately 4.3 kilometres of the pipe that was drained of water on July 11, 2018. Main breaks happen year round.

There are many contributing factors including Pipe Age, Pipe Material and Soil Conditions and Temperature. See Water outages and main breaks for more information. Skip to main content, Skip to footer, Search, Search, Home, Browse Data, About, Developer, Info, Help, Sign In, Menu.
