The cat<<EOF syntax is very useful when working with multi line text in Bash eg. when assigning multi line string to a shell variable file or a pipe

Examples of cat<<EOF syntax usage in Bash Apr 1 2022 xnew_from_cat= torch.cat x x x 1 print f {xnew_from_cat.size } print stack serves the same role as append in lists. i.e

it doesn't change the original vector space but instead adds a new index to the new tensor so you retain the ability get the original tensor you added to the list by indexing in the new dimension Jun 6 2013 catcountryInfo.txt grep v ^ >countryInfo n.txt After some research I found that cat is for concatenation and grep is for regular exp search don't know if I am right but what will the above command result in since both are combined together? Thanks in Advance

EDIT I am asking this as I don't have Linux installed. Else I could test it Jul 4 2016 While cat does stand for concatenate what it actually does is simply display one or multiple files in order of their appearance in the command line arguments to cat

The common pattern to view the contents of a file on Linux or *nix systems is cat<file> The main difference between cat and Git's cat file is that it only displays a single file hence the file part

Git's cat file doesn't May 26 2021 Can someone please shed some light on an equivalent method of executing something like `cat file1` in Linux? What I want to do is to give control to the keyboard stream which is `cat` ls there replacement for cat on Windows [closed] Asked 17 years 3 months ago Modified 9 months ago Viewed 552k times An essential difference between cat and print is the class of the object they return

This difference has practical consequences for what you can do with the returned object. If `cat` with <<EOF>> will create or append the content to the existing file won't overwrite

whereas `cat` with <<EOF>> will create or overwrite the content May 14 2009 46 There are a few ways to pass the list of files returned by the find command to the cat command though technically not all use piping and none actually pipe directly to cat

The simplest is to use backticks ' `cat` find [whatever]' This takes the output of find and effectively places it on the command line of cat Mar 10 2021 If cat doesn't stop it's because the symbol is for parameter. And you run cat with no parameter

Actually it didn't run indefinitely the shell waits for you to enter the end of the command. cat is a command that simply reads files. In your example it will
