Official Google Classroom Help Center where you can find tips and tutorials on using Google Classroom and other answers to frequently asked questions This article is for students. Teachers go here

If youre new to Classroom this article will show you around and help you complete common tasks Change your role Join aclasswith aclasscode in Google Classroom Join aclassin Google Classroom with an email invite Join aclasswith aclasslink in Google Classroom Troubleshooting for students How do I sign out from Google Classroom? Sign in to multiple accounts at once Google Classroom Help Community Give feedback about this article Trouble joining aclass? I forgot or lost theclasscode To join aclass you just need to enter theclasscode once

After you join you dont need to enter the code again. If you forget lose or delete the code before you join theclass ask your teacher to share it with you Aclassis a blueprint which you use to create objects

An object is an instance of aclass it s a concrete thing that you made using a specificclass. So object and instance are the same thing but the word instance indicates the relationship of an object to itsclass. This is easy to understand if you look at an example

For example suppose you have aclassHouse. Your own house Jun 11 2015 25 The classis a special keyword which is provided by PHP to get the fully qualifiedclassname. See the official PHP documentation about class However what stumps me is the usage ofClass<>

The javaclass Classis supposed to also take a template name or so I m being told by the yellow underline in eclipse. I don t understand what I should put in there

The whole point of theClassobject is when you don t fully have the information about an object for reflection and such For naming template parameters typename andclassare equivalent. 14.1.2 There is no semantic difference betweenclassand typename in a template parameter

typename however is possible in another context when using templates to hint at the compiler that you are referring to a dependent type

14.6.2 A name used in a template declaration or definition and that is dependent on a 483ways to add aclassto a DOM element in JavaScript There are multiple ways of doing this. I will show you three ways to add classes and clarify some benefits of each way

You can use any given method to add aclassto your element another way to check for change or remove them A good use of a staticclassis in defining one off
