Sep 12 2015 Committedmemory is the memory you have in your computer plus the page file. It looks like sometimes programs use too much memory and made windows store some things in the pagefile

The pagefile wasn't big enough to fit all the memory windows was storing in it so it had to increase its size

It kept increasing its size until it reached its limit Feb 28 2019 The total size of committed that is pagefile backed or it would be if you had a pagefile which you definitely should across all processes plus the OS kernel is that first number under the wordCommitted

It includes several other contributions too Chiefly the nonpaged and paged pools and any mapped regions that are mapped copy on write Dec 13 2025 I have 64GB of RAM and Windows 11 is showing very high usage 60.6gb in use and 110gbcommitted

Looking at processes in the task manager the Memory column shows 96% usage which matches that but the memory listed for all the processes add up to 10gb at most I have a 4 GB RAM memory. In task manager you can see thaCommittedmemory is 5 6 7 9 GB RAM

Why that if In use memory is just 3 1 GB ? Is Windows using the Page File ? My system runs high oncommittedmemory out of 8GB RAM + 2 GB page file 85% memory iscommitted. Physical usage is at some 65%

How can I identify what process es is allocating most of the comm May 4 2025 That temporary state would require lots ofcommittedmemory

man 2 fork Under Linux fork is implemented using copy on write pages so the only penalty that it incurs is the time and memory required to duplicate the parent's page tables and to create a unique task structure for the child. May 22 2017 Thecommittedmemory though is maxing out

When I check to see what program is using a high amount ofcommittedmemory in Resource Monitor everything is pretty low usually less than 500MB

Windows will say Firefox or Chrome is using too much memory but I can't find any evidence of this with Task Manager Resource Monitor or Process Explorer Aug 26 2020 When I initially start up thecommittedmemory is a sane size it starts around 4 8 GB and grows to about 11 GB once all my programs have started Discord Steam drivers etc

The responsiveness problems start once it passes about 35 GBcommitted Oct 2 2023 To clarify the question

Task manager as well as process informer report highcommittedamount of memory
