Dump RestoreFiles Debugging withGDB You can use the commands dump append and restore to copy data between targetmemoryand afile

The dump and append commands write data to afile and the restore command reads data from afileback into the inferiorsmemory.Filesmay be in binary Motorola S record Intel hex Tektronix Hex or Verilog Hex format however GDBcan only append to Sep 5 2017 I d like to flash a binaryfileinto my ARM MCU flashmemoryusinggdb

Currently I m able toloadan elf like this arm none eabi gdb command=flash.gdb myfirmware.elf cat flash.gdbset Nov 1 2022 Then using the load command toloadfileintomemory

In my case I specify 0x70000 as the address where toloadthe data gdb loaddata.bin.elf 0x70000 To check thememoryI can use the x command

Below I askgdbto examine 16 bytes in hexadecimal format starting from address 0x70000 gdb x 16xb 0x70000 Everything looking good! So this is how I canloadany arbitrary data Further Reading GDB Setting WatchpointsGDBScriptGDBcommands can be placed infilesand run in the following ways ~ .gdbinit and

.gdbinit are executed automatically onGDBstartup. On the command line with x command On systems withmemory mappedfiles an auxiliaryfile'filename.syms may hold symbol table information for filename. If so GDBmaps in the symbol table from 'filename.syms starting up more quickly

See the descriptions of the options ' mapped and ' readnow available on the command line and with the commandsfile symbol file or add symbol file for more information Figure 2.5 shows the high level sequence diagram forGDBin response to theload command

This maps to the current target s to_loadfunction which in most cases will end up calling the current target s to_xfer_partial function once for each section of the image toloadit intomemory Nov 8 2024 Solved Code snippet forloadinga tablefrom filegdbintomemory? Tried several but didn t seem to work MemoryConnectionProperties memoryConnectionProperties2 = Ifmemory mappedfilesare available on your system through the mmap system call you can use another option ' mapped to causeGDBto write the symbols for your program into a reusablefile.
