Mar 22 2016 The above command line defines an environment variable with name `fileName` starting with fixed string `db_` appending with `%date ~ 4 4%` the last four characters of the current locale date which is obviously the year appending with `%date ~ 10 2%` the tenth and ninth characters from right side of the current locale date which is most likely the month Dec 21 2009 Is there a built in method for converting a date to a datetime in Python for example getting the datetime for the midnight of the given date? The opposite conversion is easy datetime has a `.date` Mar 4 2010 where `A.Date >= 2010 04 01` it will do the conversion for you but in my opinion it is less readable than explicitly converting to a `DateTime` for the maintenance programmer that will come after you Apr 8 2014 I want to convert `java.time.LocalDate` into `java.util.Date` type

Because I want to set the date into `JDateChooser`. Or is there any date chooser that supports java time dates? I tried using `$ date` in my bash shell script however I want the date in `YYYY MM DD` format

How do I get this? `newDate.getTime` Functionally equivalent to `newDate.valueOf(Date.now)` Functionally equivalent to the 2 methods above As mentioned in the comments and MDN links `Date.now` is not supported in Internet Explorer 8

So if IE 8 compatibility is a concern you should use `newDate.valueOf` at the cost of slightly diminished code readability Sep 7 2023 Delete all old emails after a certain date I have too many emails

How do I delete all those older than a certain date? I haven't tried anything because I can't keep selecting and deleting 10 000 old emails Just giving a more up to date answer in case someone sees this old post

Adding `utc=False` when converting to datetime will remove the timezone component and keep only the date in a `datetime64 [ns]` data type Apr 21 2020 date if you want to cast into date then you can first cast to `datetime64[ns]` and then use `dt.date` to get a column of datetime date objects Aug 12 2011 `Instant.parse(2011 08 12T20 17 46.384Z)` ISO 8601 This format is defined by the sensible practical standard ISO 8601

The T separates the date portion from the time of day portion. The Z on the end means UTC that is an offset from UTC of zero hours minutes seconds. The Z is pronounced Zulu. `java.time` The old date time classes bundled with the earliest versions of Java have proven.
