Viral zoonoses are diseases caused by viruses that are transmissible from vertebrate animals to humans with varying degrees of severity in human infection

These viruses can be hosted by mammals birds reptiles and possibly amphibians often causing little or no disease in their animal hosts A zoonosis is a disease [1] plural zoonoses or zoonotic disease is an infectious disease of humans caused by a pathogen an infectious agent such as a virus bacterium parasite fungi or prion that can jump from a non human vertebrate to a human Most of these emerging diseases are caused by viruses that are primarily RNA viruses of animal origin with a long history of adaptation to their natural hosts becoming pathogenic when crossing species barriers [1] Sep 1 2025 This review synthesizes evidence on drivers clinical manifestations and socioeconomic burdens of viral zoonoses while highlighting novel perspectives on equity gaps co-infection dynamics and limitations of global preparedness initiatives Apr 7 2025 However animals can sometimes carry harmful germs that can spread to people and cause illness these are known as zoonotic diseases or zoonoses. Zoonotic diseases are caused by harmful germs like viruses bacterial parasites and fungi Apr 14 2025 This chapter describes the current understanding of the pathways and mechanisms involved in the emergence of viral zoonoses and their impact on developing strategies for controlling zoonotic diseases Jul 29 2020 Some diseases such as HIV begin as a zoonosis but later mutate into human only strains

Other zoonoses can cause recurring disease outbreaks such as Ebola virus disease and salmonellosis Mar 6 2024 Most zoonotic illnesses are bacterial parasitic or viral

Other zoonoses include ringworm a fungal infection and variant Creutzfeldt Jakob disease vCJD commonly called mad cow disease a form of prion disease Jun 7 2025 Zoonotic diseases are not just an accident of nature they are often the result of intricate biological processes that allow viruses to adapt evolve and find new hosts

For a virus to move from animals to humans it has to navigate a complicated path. Viruses are nothing if not adaptable Nov 14 2025 Vector borne and zoonotic diseases are caused by viruses bacteria or parasites that are transmitted to humans from animals or insects

Some diseases that originate in animals must be transmitted through a vector e.g. mosquito tick in order to infect a human.
