The 53 bitsof doubles give about 16 digitsofprecision. The 24 bitsoffloat s give about 7 digitsofprecision Dec 31 2021 I ve read about the difference between doubleprecision and single precision. However in most cases float anddoubleseem to be interchangeable i.e

using one or the other does not seem to affec 494 ADoubleis not an Integer so the cast won t work. Note the difference between theDoubleclass and thedoubleprimitive

Also note that aDoubleis a Number so it has the method intValue which you can use to get the value as a primitive int Oct 20 2017 From what I have read a valueofdata typedoublehas an approximate precisionof15 decimal places

However when I use a number whose decimal representation repeats such as 1.0 7.0 I find tha Jun 19 2012 Adoublewhich is usually implemented with IEEE 754 will be accurate to between 15 and 17 decimal digits

Anything past that can t be trusted even if you can make the compiler display it Format %lf in printf was not supported in old pre C99 versionsofC language which created superficial inconsistency between format specifiers fordoublein printf and scanf So when should I useDoubleand when to usedouble? Thank you F505 I would recommenddoublewhen just doing basic floating point computation

If there is a lotofstring conversion needed then I would use the classDoubleSome thing important to note is that a complex data typeDoublecan be null The termdoubleprecision is somethingofa misnomer because the precision is not reallydouble

The worddoublederives from the fact that adouble precision number uses twice as many bits as a regular floating point number

For example if a single precision number requires 32 bits itsdouble precision counterpart will be 64 bits long Apr 22 2015 Possible Duplicate longdoublevsdoubleI am unable to understand the difference between between longdoubleanddoublein C and C++

Can anyone help? doubled = double num denom But is there another way to get the correctdoubleresult? I don t like casting primitives who knows what may happen.
