The short beaked echidna *Tachyglossus aculeatus* is found in southern southeast and northeast New Guinea and also occurs in almost all Australian environments from the snow clad Australian Alps to the deep deserts of the Outback essentially anywhere ants and termites are available. An echidna has a tiny face with small eyes and a long nose sometimes called a beak.

The eyes don't help the echidna see well but its acute sense of hearing and smell give this unusual mammal the information it needs to know to survive. Echidna any of four species of peculiar egg laying mammals from Australia, Tasmania and New Guinea that eat and breathe through a bald tubular beak protruding from a dome shaped body covered in spines. Apr 9 2025 While the echidna pronounced in KID na is considered a mammal because it's warm blooded has hair on its body and produces milk for its young this large hedgehog like creature is in a class of its own. Mar 18 2022 An echidna has a tiny face with small eyes and a long nose which is sometimes called a beak.

While they don't have great vision they have an acute sense of hearing and smell. Facts about the egg laying mammal the one and only unique and super cute Echidna. Jul 1 2025 There are four species of echidna that are alive today one species of short beaked echidna and three species of long beaked echidnas.

Read on to learn more fun facts about these strange. The four species of echidna and the platypus are the only surviving members of an ancient order of mammals that lay eggs but also have mammary glands that produce milk to nurse their young. With tough claws and short but powerful front feet an echidna can quickly dig straight down into the earth until only its spiny rear end can be seen.

Mother echidnas dig a burrow for hiding when caring for an egg or a baby. And they're called spiny anteaters but those aren't spines they're rigid modified hairs. A baby echidna is a puggle.
