Jul 22 2019 Aformatted string literal orf string isastring literal that is prefixed withforF. These strings may contain replacement fields which are expressions delimited by curly braces {}

While other string literals always haveaconstant value formatted strings are really expressions evaluated at run time. Some examples of formatted string L Specifies thatafollowinga A e E f F g or G conversion specifier applies toalong double argument

The same rules specified for fprintf apply for printf sprintf and similar functions f strings are cute and remind me of Ruby syntax

But they don t seem to havealot of advantages and as you ve said they unnecessarily break compatibility with Python < 3.6 Aug 16 2018 How can I usef string with logic to format an int asafloat? I would like if ppl is True to format num to 2 decimal places and if ppl is False to rformat it as whatever it is

Something like st Reddit isanetwork of communities where people can dive into their interests hobbies and passions. There sacommunity for whatever you re interested in on Reddit Dec 3 2012 Afew of these don t do anything interesting or even anything visible

I have indicated those which don t do anything visually

F3 + S Force Reload Visually does little lags flickers F3 + T Refresh Textures Visually does little lags flickers Shift + F3 +F Increase Render Distance F3 +F Decrease Render Distance F3 +A Load Renderers essentially reloads all visual I haveastring in which I would like curly brackets but also take advantage of thef strings feature

Is there some syntax that works for this? Here are two ways it does not work

I would like to Is there an easy way with Pythonf strings to fix the number of digits after the decimal point? Specificallyf strings not other string formatting options like .format or % For example let s s Unlikef strings the { } placeholders are not expressions and you can t use arbitrary Python expressions in the template

This isagood thing you wouldn t want end users to be able to execute arbitrary Python code in your program. See the Format String Syntax documenation for details JPython only runs on Python 2.7 so nof strings. IronPython will only run on 2.7 or 3.4 so again nof strings

PyJS and TinyPy don t support any version of Python 3 so won t supportf strings
