Python scripts used byGDB should be installed in data directory python where data directory is the data directory as determined atGDB startup see Data Files

This directory known as the `python` directory is automatically added to the `PythonSearchPath` in order to allow the Python interpreter to locate all scripts installed at this location 4 days ago. Setup with Python built from source. When you build CPython from source debugging information should be available and the build should add a `python gdb.py` file to the root directory of your repository.

To activate support you must add the directory containing `python gdb.py` to GDB's auto load safe path Aug 8 2012. Thanks. That does work but I was hoping there was something that could do this in a more automated fashion.

This requires manually adding each script to the `.gdbinit` plus including a full path to my attempts to source a Python file without the full path resulting in bizarre errors.

I suppose I could have a bash script that automatically generates a `.gdbinit` file and passes all the paths based on Apr 30 2017. Sometimes adding another source path is not enough if you have a complex hierarchy.

In this case you can add a substitution rule for `sourcepath` with `set substitute path`. GDB command. This package provides a set of tools for debugging Python code with GDB including Python code breakpoints. GDB breakpoints operate on native shared libraries C assembler code.

Since Python is an interpreted language it is not possible to set Python code breakpoints directly from the GDB console. Add a directory containing Python source code to safe path to automatically load `python gdb.py` when debugging Python.

Add the following line to your `~ .gdbinit` 23.1.gdb7 and later. In gdb7 support for extending gdb with Python was added. When CPython is built you will notice a `python gdb.py` file in the root directory of your checkout.

Read the module docstring for details on how to use the file to enhance gdb for easier debugging of a CPython process. This is the most important tool for debugging Python code running on the C stack! Since GDB 7 the CPython source includes a Python script `Tools/gdb/libpython.py` that extends GDB's capabilities.

Command Load the extension often automatically done if GDB is configured correctly and you're debugging a CPython executable.
