Here the `get` method finds a key entry for `e` and finds its value which is 1

We add this to the other 1 in `characters.get character 0 + 1` and get 2 as result
The `get` set pattern provides a structure that allows logic to be added during the setting set or retrieval get of a property instance of an instantiated class which can be useful when some instantiation logic is required for the property
Ultimately it probably doesn't have a safe `.get` method because a dict is an associative collection values are associated with names where it is inefficient to check if a key is present and return its value without throwing an exception while it is super trivial to avoid exceptions accessing list elements as the `len` method is very fast

The `.get` method allows you to query the value Aug 14 2012 However if when your data structure gets more complex `http GET` and without JSON your programming and ability to recognise the data gets very difficult

Therefore unless you could keep your data structure simple I urge you adopt a data transfer framework

If your requests are browser based the industry usual practice is JSON ajax
`jquery simple get request` Asked 13 years 10 months ago Modified 6 years 4 months ago Viewed 264k times 11 request.
`GET` is the dictionary of the `GET` variables in the `http` request made to your server for example Feb 5 2009 Is it possible to pass parameters with an `HTTP get request`? If so how should I then do it? I have found an `HTTP post request` link

In that example the string `postData` is sent to a webserver. I wo Sep 6 2008 From what I can gather there are three categories Never use `GET` and use `POST` Never use `POST` and use `GET` It doesn't matter which one you use

Am I correct in assuming those three cases? If so wha So I've come up with a simpler script that returns all the `GET` parameters in a single object

You should call it just once assign the result to a variable and then at any point in the future get any value you want from that variable using the appropriate key
How to get `GET` variables from request in JavaScript? Does `jQuery` or `YUI!` have this feature built in?.
