Apr 15 2014 Expected girls from one couple $\$ \{ = 0.5 \cdot 1 + 0.25 \cdot 1 = 0.75 \$$
Expected boys from one couple $\$ \{ = 0.25 \cdot 1 + 0.25 \cdot 2 = 0.75 \$$ 1 As I said
this works for any reasonable rule that could exist in the real world

An unreasonable rule would be one in which the expected children per couple was
infinite Feb 9 2022 Considering the population of girls with taste disorders I do
a binomial test with number of success $k = 7$ number of trials $n = 8$ and
probability of success $p = 0.5$ to test my null hypothesis $H_0 =$ my cake tastes good
for no more than 50% of the population of girls with taste disorders

In python I can run `binomtest 7 8 0.5 alternative='greater'` which gives the
following result Jul 4 2023 1st 2nd boy girl boy seen boy boy boy seen girl boy
The net effect is that even if I don't know which one is definitely a boy the
other child can only be a girl or a boy and that is always and only a 1/2
probability ignoring any biological weighting that girls may represent 51% of births
or whatever the reality is Aug 18 2017 Probability of having 2 girls and
probability of having at least one girl Ask Question Asked 8 years 4 months ago
Modified 8 years 4 months ago Jan 10 2024 Use standard type for Greek letters
subscripts and superscripts that function as identifiers i.e

are not variables as in the subscript girls in the example that follows and
abbreviations that are not variables e.g. log GLM WLS. Use bold type for symbols
for vectors and matrices. Use italic type for all other statistical symbols Apr
1 2018 Source Harvard Statistics 110 see 17 p

29 of pdf. A couple decides to keep having children until they have at least one
boy and at least one girl and then stop

Assume they never have two Mar 2 2017 A probability problem In how many
different ways can 5 people sit around a round table? Is the symmetry of the table
important? Answer If the symmetry of the table is not taken into account the May
16 2021 When you use a paired T test you are essentially doing a one sample test
where your one sample consists of the paired differences between outcomes in two
groups

If you create a new sample of these difference values and then apply the formula
for a one sample T test you will see that this is equivalent to the paired test
Echoing the first answer. Don't bother to convert just model the counts and
covariates directly

If you do that and fit a Binomial or equivalently logistic regression model to
the boy/girl counts you will if you choose the usual link function for such
models implicitly already be fitting a covariate smoothed logged ratio of boys
to girls. That's the linear predictor
