Newton s law of gravity is a mathematical description of the way bodies are observed to attract one another based on many scientific experiments and observations

The gravitational equation says that the force of gravity is proportional to the product of the two masses  $m_1$  and  $m_2$  and inversely proportional to the square of the distance  $r$  between their centers of mass

Mathematically Data from NASA satellite observations provide information about Earth s mean gravity field and inform monthly maps of the time variable gravity field both of which are useful tools for scientists as they study the planet s changing climate Dec 28 2020 A new satellite mission sheds light on Earth s gravity field and provides clues about changing sea levels Gravity causes the last of the star s matter to collapse inward and compact

This is the white dwarf stage which is extremely dense. White dwarfs shine with a white hot light but once all of their energy is gone they die

The star has now reached the black dwarf phase Dec 28 2020 Gravity waves are a real challenge because they are largely invisible to climate and weather models. The crux of the problem is the way satellites see them

Satellite instruments sweep the atmosphere in either a vertical or horizontal plane so their measurements are either one or two dimensional 1

Introduction Review the definition of gravity Drop a ball and explain why it falls downward Explain that the strength of a gravitational pull is determined by the masses of the objects involved and the distance between the objects Hold up a scale model of Earth and a scale model of the Sun

Inquire as to which object would exert a stronger pull This map created using data from the Gravity Recovery and Climate Experiment GRACE mission reveals variations in the Earth s gravity field

Dark blue areas show areas with lower than normal gravity such as the Indian Ocean far right of image and the Congo river basin in Africa

Dark red areas indicate areas with higher than normal gravity Apr 19 2021 Gravity is not constant across Earth and the amount of force exerted by gravity changes with changes in mass

These uneven mass distributions influence satellite trajectories since areas of higher mass exert more force than areas of lower mass from Newton s Second Law of Motion  $\text{Force} = \text{mass} \times \text{acceleration}$  or  $F = ma$  Dec 27 2020 To account for gravity and other effects in their equations the scientists used a model of Earth s gravitational field based on data from the GRACE satellite mission
