I am using nc command in my Linux box like below to check if a port is listening. This displays success message nc z 192.168.0.2 9000. This displays 0 echo \$? I have combined it in a shell scr May 24 2023. nc is the wrong tool for this job to a greater or lesser degree based on which version you have the more appropriate ones have the option to fork a subprocess for each new incoming connection.

Use a proper built to purpose superserver xinetd was the up and coming standard 25 years ago today. I'd suggest tcpsvd Apr 6 2015. The old nc version doesn't allow using different usernames for the bastion and target server.

Also I recently learned that ssh 7.3 and newer introduced a ProxyJump parameter which is a more user friendly option to the ones you mentioned Feb 14 2018. Inverse host lookup failed simply means that nc wanted to print which host name 10.0.0.10 corresponds to but couldn't.

UNKNOWN is simply what it then prints as the host name. This is distinct from I looked it up but it doesn't seem to correspond to anything which is what happens outside the container.

To be perfectly explicit connecting to the host succeeded but looking up its name Jun 5 2017. I'm trying to convert a netCDF file to either a CSV or text file using Python. I have read this post but I am still missing a step I'm new to Python.

It's a dataset including latitude longitude. So I know the nc has different versions like openbsd netcat and GNU netcat. You can change the nc in debian to the openbsd version but I choose to change the software like corkscrew because the names of the two versions of nc in system are same and many people don't understand it well.

My approach is as follows:

sudo apt install corkscrew Jan 27 2022. Is the following CSG for a^nb^nc^n correct? S >aSbC abc Cb >bC C >c If not please explain why? Apr 19 2015. How to create a TCP connection using nc which listens to multiple hosts? nc l p 12345 Aug 1 2016. nc z hostname port Into this cat dev null nc hostname port. You might also want to add in an option like w 1s to avoid the long default timeout.

There might be a cleaner combination of options that avoids the need for the dev null but I couldn't figure out what I want to read .nc files by netCDF4 using conda but my files look like this something.3520\_nc. What to do with this it's still .nc file right? Should I rename it? Or after I downloaded it is it.
