Here the `get` method finds a key entry for `e` and finds its value which is 1

We add this to the other 1 in `characters.get` character 0 + 1 and `get2` as result  
The `get` set pattern provides a structure that allows logic to be added during the setting set or retrieval get of a property instance of an instantiated class which can be useful when some instantiation logic is required for the property  
Ultimately it probably doesn't have a safe `.get` method because a dict is an associative collection values are associated with names where it is inefficient to check if a key is present and return its value without throwing an exception while it is super trivial to avoid exceptions accessing list elements as the `len` method is very fast

`request.GET` is the dictionary of the GET variables in the http request made to your server for example Feb 5 2009 Is it possible to pass parameters with an HTTP get request? If so how should I then do it? I have found an HTTP post request link

In that example the string `postData` is sent to a webserver. I wo Sep 6 2008 From what I can gather there are three categories Never use GET and use POST Never use POST and use GET It doesn't matter which one you use

Am I correct in assuming those three cases? If so what How to get GET variables from request in JavaScript? Does jQuery or YUI! have this feature built in?  
PowerShell `sGet ADGroupMember` cmdlet returns members of a specific group

Is there a cmdlet or property to get all the groups that a particular user is a member of? Jun 11 2009 I'm developing a new RESTful webservice for our application. When doing a GET on certain entities clients can request the contents of the entity. If they want to add some parameters for example s.
