Mar 2 2010 In Python what exactly does `import*` import? Does it `import__init__.py` found in the containing folder? For example is it necessary to declare `from project.model import__init__` or is `from proj` Feb 25 2012 271 Many people have already explained about `import` vs `from` so I want to try to explain a bit more under the hood where the actual difference lies

First of all let me explain exactly what the basic `import` statements do. `import X` Imports the module X and creates a reference to that module in the current namespace Nov 3 2020 `import { BrowserRouter as Router Route Switch } from react router dom` What is the relationship between Router Route Switch and BrowserRouter? Is this a form of destructuring? If so I thought destructuring was done using the following syntax `Import aliases` are where you take your standard `import` but instead of using a pre defined name by the exporting module you use a name that is defined in the importing module How do `import` files in Python? I want to `import` a file e.g

`file.py` a folder a file dynamically at runtime based on user input one specific part of a file e.g. a single function Oct 28 2014 I've tried to find a comprehensive guide on whether it is best to use `import module` or `from module import`

I've just started with Python and I'm trying to start off with best practices in mind. Bas Dec 16 2024 This question is similar to Can `import movie.py`.editor

If you believe it's different please edit the question make it clear how it's different and or how the answers on that question are not helpful for your problem Jul 7 2009 The `from [module] import [identifiers]` form is more future proof because you can easily see when one `import` will be overriding another

Also note that variables aren't different from functions in Python in terms of how they're addressed every identifier like `name` or `sayBye` is pointing at some kind of object Jun 28 2009 I want to inherit from a class in a file that lies in a directory above the current one

Is it possible to `relatively import` that file? In my case I refactored a single python script into different modules leaving some old `.py` and `.pyc` files around and stumbled on the `cannot import name` error.
