Jun 10 2010 Gentoo Wiki told me the following Warning GCC 4.2 and above support march=native. march=native applies additional settings beyond march specific to your CPU

Unless you have a specific reason Oct 5 2018 For O0 whether march=native or march=<generic> is the default still specifies the same family so both are perfectly compatible with O0 and whenever another optimization level is specified march=native is beneficial to performance

So for me the fact that O0 is the default doesn't matter for march's default Oct 12 2024 march=foo implies mtune=foo unless you also specify a different mtune. This is one reason why using march is better than just enabling options like maxx without doing anything about tuning

Caveat march=native on a CPU that GCC doesn't specifically recognize will still enable new instruction sets that GCC can detect but will leave mtune=generic

Use a new enough GCC that knows about As far as I know the compilation option for MSVC that tells the compiler to use special available instruction is arch

On clang linux we can use march=native to automatically detect the architecture Nov 24 2023 I want to change it to march=x86\_64 in cmake How to do it? Find out how exactly PCL adds march=native flag

If it does that via variable CMAKE\_CXX\_FLAGS then you may try to modify that variable but note about variables scoping rules. If PCL adds the flag to some property then you may try to modify that property. CMake doesn't give you a control over combined compiler flags

You need to Sep 25 2024 GNU assembler version 2.38 x86\_64 linux gnu using BFD version GNU Binutils for Ubuntu 2.38 Assembler messages Fatal error invalid march= option 'rv64imafdc\_zicsr' Thanks for any response and help! Best regards

Troy Nov 5 2018 Is there a way to get gcc to output the available march=arch options? I'm getting build errors tried march=x86\_64 and I don't know what my options are

The compiler I'm using is a proprietary unrecognized command line option arch did you mean march= ? Asked 4 years 6 months ago Modified 1 year 7 months ago Viewed 3k times Jul 27 2022 What are the differences and tradeoffs between march=haswell march=core avx2 and maxv2 for compiling avx2 intrinsics? I know that maxv2 is a flag and march=haswell core avx2 are architectures which just translate to a bunch of flags

So maxv2 is a subset of the other two. But beyond that how do I choose the right one for my application? As I understand it march=native will detect the ISA and
