Sep 28 2012 If this is what you are asking %pand %Fp print out a pointer specifically the address to which the pointer refers and since it is printing out a part of your computer s architecture it does so in Hexadecimal

In C you can cast between a pointer and an int since a pointer is just a 32 bit or 64 bit number depending on machine architecture referring to the aforementioned chunk of memory Learn when to use <p> for paragraphs and <br> for line breaks in HTML on Stack Overflow Nov 14 2015 What does this regexp mean \p{Lu} ? Asked 11 years 3 months ago Modified 10 years 1 month ago Viewed 27k times Feb 9 2010 What is the difference between lt p> and lt div>? Can they be used interchangeably? What are the applications? Jan 5 2015 What does pstand for in set p=? I know that enables a switch and I m fairly sure that I know a is for arithmetic

I ve heard numerous rumours some saying pis for prompt others stating it Mar 3 2010 %pwill also use an adequate textural representation for pointer for the platform

On platforms where it is common to represent pointer in hex this won t make a difference as long as the size is correct but for a segmented architecture do you remember DOS? it may use a segment offset representation Feb 13 2013 2l would say the second one than the <p> is not inheriting attributes of <a> and keeping it s original formatting Mar 12 2012 5 I am still struggling to understand the difference between \*p p andp

From my understanding \* can be thought of value pointed by and as adress of. In other words \* holds the value while holds the adress

If this is true then what is the distinction between \*pandp? Doesn tphold the value of something just like \*p? Dec 15 2009 The <p> tag is aparagraph and as such it is a block element as is for instance h1 and div whereas span is an inline element as for instance b and a Block elements by default create some whitespace above and below themselves and nothing can be aligned next to them unless you set a float attribute to them

Inline elements deal with spans of text inside a paragraph. They typically I m confused about what the poption does in Unix. I used it for a lab assignment while creating a subdirectory and then another subdirectory within that one

It looked like this mkdir pcmps012m lab1 This is in a private directory with normal rights rli dwka. Oh and would someone mind giving a little explanation of what rli dwka means?.
