What Is aGlobalVariable? A computer program is essentially a list of instructions for a computer to carry out when you run it Mar 18 2024 Aglobalvariableis avariablethat is declared outside any function and is accessible to all routines in our program

So its scope isglobal its initialized when we run our software and lasts while the program is running. We mostly declareglobalvariablesat the top of a module file. Any function we define at any point in the program can change anyglobalvariable
