I would like to understand how the built in functionpropertyworks. What confuses me is thatpropertycan also be used as a decorator but it only takes arguments when used as a built in function In the interface there is no code

You just specify that there is apropertywith a getter and a setter whatever they will do. In the class you actually implement them. The shortest way to do this is using this { get set } syntax

The compiler will create a field and generate the getter and setter implementation for it Apropertycan have a get accessor only which is done in order to make thatpropertyread only When implementing a get set pattern an intermediate variable is used as a container into which a value can be placed and a value extracted When accessing aproperty the dot syntax images.main supposes I think that it already exists

I had such problems without Typescript in vanilla Javascript where I tried to access data as return json.property[0].index where index was a variable

But it interpreted index resulting in a cannot findproperty index of json.property[0] In my situation I had mypropertyauto initialize a command in a ViewModel for a View. I changed thepropertyto use expression bodied initializer and the command CanExecute stopped working

Here s what it looked like and here s what was happening For instance in this article I read this class attribute or classproperty field or data member I have seen rather well cut out questions that show that there is a difference between classpropertyand class field for instance What is the difference between a Field and aPropertyin C ? Sep 10 2011 Thepropertyallows you to use the former syntax while giving you the flexibility of change of the latter

In Python you can define getters setters and delete methods with thepropertyfunction

If you just want the readproperty there is also a propertydecorator you can add above your method Sep 16 2010 Using PropertyInfo to find out thepropertytype Asked 15 years 3 months ago Modified 5 years 2 months ago Viewed 204k times Apr 7 2018 187 We may get the messagePropertyhas no initializer and is not definitely assigned in the constructor when adding some configuration in the tsconfig.json file so as to have an Angular project compiled in strict mode Jul 9 2012 Get value of a specific objectpropertyin C without knowing the class behind Asked 13 years 5 months ago Modified 4 years 8 months ago Viewed 213k times.
