Object Inheritance Inheritance is a well established programming principle and PHP makes use of this principle in its object model. This principle will affect the way many classes and objects relate to one another

For example when extending a class the subclass inherits all of the public and protected methods properties and constants from the parent class. Unless a class overrides PHP What is Inheritance? Inheritance in OOP = When a class derives from another class

The child class will inherit all the public and protected properties and methods from the parent class. In addition it can have its own properties and methods. An inherited class is defined by using the extends keyword

Let's look at an example May 22 2025 In PHP inheritance allows a class to inherit properties and methods from another which adds code reusability and creating a hierarchy for efficient structuring Sep 10 2025 Inheritance in PHP is a crucial OOPs concept and makes PHP programming a lot more convenient

Learn about its types syntax for inheriting a class and more! May 24 2025 Inheritance in PHP is the ability of a class known as a child class or subclass to derive properties and methods from another class known as a parent class or base class

Using inheritance you can extend existing classes and modify or add new functionalities without changing the original code

Syntax `class ParentClass { Properties and methods } class ChildClass extends ParentClass` In PHP when a new class is defined by extending another class the subclass inherits the public and protected methods properties and constants from the parent class

You are free to override the functionality of an inherited method otherwise it will retain its functionality as defined in the parent class

Example of Multilevel Inheritance Sep 10 2025 Explore Inheritance In PHP OOP Concept Types Of Inheritance Extends Keyword Method Overriding Constructor Behavior And Using Parent To Access The Base Class Inheritance is a fundamental concept in Object Oriented Programming OOP that allows developers to create new objects from existing ones inheriting all its.
