The default for addr is usually just after the lastaddressexaminedbut several other commands also set the defaultaddress info breakpoints to theaddressof the last breakpoint listed info line to the startingaddressof a line and print if you use it todisplaya value frommemory This page explains the x command

The x command displays thememorycontents at a givenaddressusing the specified format GDBprintsmemoryaddresses showing the location of stack traces structure values pointer values breakpoints and so forth even when it also displays the contents of those addresses Jan 24 2013 Displayvalue found at givenaddressgdbAsked 12 years 11 months ago Modified 1 year 8 months ago Viewed 138k times Fortunately gdbprovides another command for examining the contents ofmemorydirectlythat is the actual bit patterns

In order to use this command we need to determine the actualmemoryaddresses where the anInt and aFloat variables are stored The encoding is set by the programming language and cannot be altered. addr startingdisplayaddressaddr is theaddresswhere you wantgdbto begin displayingmemory

The expression need not have a pointer value though it may it is always interpreted as an integeraddressof a byte ofmemory. See Expressions for more information on Use the x command to examinememory

n f and u are all optional parameters that specify how muchmemorytodisplayand how to format it addr is an expression giving theaddresswhere you want to start displayingmemory. If you use defaults for nfu you need not type the slash

Several commands set convenient defaults for addr How To ViewMemoryAt AnAddressInGDB? In this informative video we will guide you through the process of viewingmemoryat a specificaddressusing the GNU Debugger also known asGDB.
