The `shape` attribute for numpy arrays returns the dimensions of the array. If `Y` has `n` rows and `m` columns then `Y.shape` is `n m`

So `Y.shape[0]` is `n` Nov 30 2017 `yourarray.shape` or `np.shape` or `np.ma.shape` returns the shape of your ndarray as a tuple. And you can get the number of dimensions of your array using `yourarray.ndim` or `np.ndim`. i.e

it gives the `ndim` of the ndarray since all arrays in NumPy are just `n` dimensional arrays shortly called as `ndarray`s. For a 1D array the `shape` would be `n` where `n` is the number of elements in your array. `Shape[n]` expresses the shape of a 1D array with `n` items and `n 1` the shape of a `n` row  $\times$  1 column array

`R` and `R 1` just add useless parentheses but still express respectively 1D and 2D array shapes. Parentheses around a tuple force the evaluation order and prevent it to be read as a list of values e.g

in function calls Jan 7 2018 On the other hand `x.shape` is a 2 tuple which represents the shape of `x` which in this case is `10 1024`. `x.shape[0]` gives the first element in that tuple which is `10`

Here's a demo with some smaller numbers which should hopefully be easier to understand Jun 4 2015 I already know how to set the opacity of the background image but I need to set the opacity of my `shape` object

In my Android app I have it like this and I want to make this black area a bit Jul 21 2018 In `python` `shape[0]` returns the dimension but in this code it is returning total number of set

Please can someone tell me work of `shape[0]` and `shape[1]`? Code `m_train = train_set_x_orig.shape[0]` Oct 22 2018 Shape in the numpy context seems to me the better option for an argument name

The actual relation between the two is `size = np.prod shape` so the distinction should indeed be a bit more obvious in the arguments names ValueError `shape mismatch` objects cannot be broadcast to a single shape. It computes the first two I am running several thousand of these tests in a loop and then dies Mar 1 2014 I'm new to python and numpy in general

I read several tutorials and still so confused between the differences in dim ranks shape axes and dimensions. My mind seems to be stuck at the matrix Nov 19 2025 The `shape` you're targeting appears to be the Collapsed Sub Process from the BPMN Basic Shapes stencil

This is a group shape and the top level has no geometry so changing its color as you're doing in your question has no visual change. To solve this you need to find sub shape that is used to show the background.
