Nov 25 2013 What is the difference between .size and .length ? Is .size only for arraylists and .length only for arrays? In this case depending upon what your use case is you might be better off using int or long long for s1 and s2

There are some functions in C POSIX that could should use size_t but don't because of historical reasons

For example the second parameter to fgets should ideally be size_t but is int. If the sizeof the int is that important one can use int16_t, int32_t and int64_t. Need the iostream include for that if I remember correctly

What's nice about this that int64_t should not have issues on a 32bit system this will impact the performance though. Dec 17 2019 The approach basically builds on other work where people experimentally identified the sizeof primitives and typical Java objects and then apply that knowledge to a method that recursively walks an object graph to tally the total size. typedef size_t intc instead of unsigned int typedef ssize_t uintc instead of int. Because strlen string vector all use size_t so I usually use size_t

And I only use ssize_t when it may be negative. But I find that The unsigned integer types are ideal for uses that treat storage as a bit array

Using an unsigned instead of an int to gain one more bit to represent positive. In several C++ examples I see a use of the type size_t where I would have used a simple int

What's the difference and why size_t should be better? Sep 20 2013 What is the command to find the sizeof all the databases? I am able to find the sizeof a specific database by using following command: select pg_database_size(databaseName). As you know matlab deals mainly with matrices

So the size function gives you the dimension of a matrix depending on how you use it. For example 1. If you say size(A) it will give you a vector of size 2 of which the first entry is the number of rows in A and the second entry is the number of columns in A. 2

If you call size(A, 1) it will return a scalar equal to the number of rows in A. May 25 2017 The OP was asking Array.size vs Array.length. From the previous discussions it was made clear that the size Function is not part of standard JavaScript but implemented by libraries

So I'm assuming that the OP is interested in how to retrieve the real length of JavaScript arrays. I'm trying to write a script that will calculate a directory size and if the size is less than 10GB and greater than 2GB do some action. Where do I need to mention my folder name? 10GB SIZE=.
