May 2 2025 Stars are giant balls of hot gas mostly hydrogen with some helium and small amounts of other elements

Every star has its own life cycle ranging from a few million to trillions of years and its properties change as it ages. Many other stars are visible to the naked eye at night. Their immense distances from Earth make them appear as fixed points of light.

The most prominent stars have been categorised into constellations and asterisms and many of the brightest stars have proper names. Dec 20 2025 This article describes the properties and evolution of individual stars.

Included in the discussion are the sizes, energetics, temperatures, masses and chemical compositions of stars. Jun 3 2025 Stars are a fundamental component in the Universe and collectively form star clusters, galaxies and galaxy clusters.

Find out more about star names, star clusters to see with the naked eye, how to photograph stars and the science of stardust. Nov 20 2025 Stars are spherical balls of hot ionized gas plasma held together by their own gravity. Stars are the most fundamental building blocks of our universe. Stars are huge celestial bodies made mostly of hydrogen and helium that produce light and heat from the churning nuclear forges inside their cores. Sep 21 2024 Stars are massive, luminous spheres of gas mainly composed of hydrogen with smaller amounts of helium and other elements.

The lifespan of a star varies widely, generally ranging from several million to several trillion years.
