lstrip rstrip andstripremove characters from the left right and both ends of a string respectively. By default they remove whitespace characters space tabs linebreaks etc Withoutstrip bananas is present in the dictionary but with an empty string as value

Withstrip this code will throw an exception because it strips the tab of the banana line Dec 9 2012 I was told it deletes whitespace but s = ss asdas vsadsafas asfasasgas print s.strip prints out ss asdas vsadsafas asfasasgas shouldn t it be ssasdasvsadsafasasfasasgas? 3 Just to add a few examples to Jim s answer according to .strip docs Return a copy of the string with the leading and trailing characters removed

The chars argument is a string specifying the set of characters to be removed

If omitted or None the chars argument defaults to removing whitespace The String.strip String.stripLeading and String.stripTrailing methods trim white space [as determined by Character.isWhiteSpace] off either the front back or both front and back of the targeted String Oct 8 2015 3 Pointers stripreturns a new string so you need to assign that to something

better yet just use a list comprehension Iterating over a file object gives you lines not words so instead you can read the whole thing then split on spaces

The with statement saves you from having to call close manually Oct 1 2016 I want to eliminate all the whitespace from a string on both ends and in between words

I have this Python code def my_handle self sentence = hello apple sentence.strip But that Feb 19 2012 37 Thestrip method removes whitespace by default so there is no need to call it with parameters like \t or \n. However strings in Python are immutable and can t be modified i.e

the line.strip call will not change the line object

The result is a new string which is returned by the call Aug 29 2012 list = map str.strip list This will apply the function str.stripto every element in list return a new list and store the result back in list 926stripdoesn t mean remove this substring

x.strip y treats y as a set of characters and strips any characters in that set from both ends of x. On Python 3.9 and newer you can use the removeprefix and removesuffix methods to remove an entire substring from either side of the string.
