May 3 2020 It s consensus that the very similar apparent sizes of the Moon and theSunas seen from Earth is a coincidence as already answered in this site. This provides us with almost exact total solar TheSun s energy comes primarily from fusion of light elements in its core

It is estimated that a very small fraction of mass of theSun $\sim 10^{-12}$ times the abundance of hydrogen is uranium b I want to know how much lux thesunemits on a bright day I don t mean when one stares directly at thesun but rather when one walks casually outside when thesunis shining brightly

Now the Sep 6 2024 TheSunappears white at noon because the sunlight reaching the observer maintains its full spectral composition meaning that all visible wavelengths arrive in nearly equal proportions TheSunwill last at its current brightness for 9 billion more years

How long until thesungets burned down to the point where it cannot sustain life on Earth anymore? Updated I am more concer 1 TheSunseems brighter more dazzling if there is more scattering in the atmosphere

TheSunwould actually look very small to us in the sky if there were no atmosphere it s the same angular size as the moon and most of the brightness seen in the direction of thesunis from small deflection rayleigh scattering Nov 29 2016 First we should speak of acceleration rather than force because like I said earlier all objects at a given distance from theSunexperience different forces but the same acceleration

You ask how come theSunis strong enough to keep the distant planets in orbit but I don t fall into it? Nov 26 2014 TheSundoes not rise it is the horizon that goes down

You say thatSunrises in the East with a certain degree of oscillations due to the tilt of the axis just because the Earth spins from West to East

The revolution affects the difference between sidereal time and solar time and makes the solar day ≈ 4 minutes longer If the Earth spinned in the opposite direction theSunwould Feb 15 2017 If this is the case then when we read things like what timesunsets and rises on websites books calendars other official times et al does that mean when we see for example sunset at 18 35 is the time denoting the actualsunset taking into account of the mirage or what is visible to us 3 TheSun moon earth and so on all move around each other

The reason we say the earth moves around thesunis because the effects are more visible on a macro scale and easier to predict with reasonable precision.
