Dec 28 2022 A lightning bolt is a consequence of and contributor to a large complex rapidly changing electric field

The range of these changes is small in air the magnitude of the induced voltage varies roughly as the inverse square of the distance to the lightning bolt although the ground is a weak conductor that adds some complexity to that Apr 11 2021 Why does thunder that is heard about five or ten seconds after the lightning is seen start as relatively quiet high pitched crackling thunder which is about five or ten seconds later than that Aug 25 2018 According to Wikipedia an average lightning strike has \$1\$ TW power the whole world used \$16\$ TW of power in 2006

The lightning strike lasts for \$30\$ microseconds. Does this mean that you get \$ Jul 13 2017 During a recent thunderstorm in an urban area I saw lightning strike within about half a mile estimated as such because I heard the thunder about 2 seconds after I saw the strike

What surprised If I understand correctly lightning is the discharge of electricity from the atmosphere into the planet. However if I switch on a lamp the wires are not causing thunder or any audible sound

Jul 19 2020 I understand that rubber shoes might not provide protection against direct lightning strikes

However would shoes with rubber soles provide any form of protection against cloud to ground lightning strikes where the electrical current goes through the ground ? I am curious what causes the charge build up in a cloud before lightning occurs

I have seen in a few places such as this that the process is not fully understood Mar 21 2014 If the thunder is a low pitched rumble that was several miles away. More boom less rumble closer. More rumble less boom farther away

My rough estimation is that if the lightning is more than two or three miles away 10 15 second gap between lightning and thunder you won't hear it much although farm animals and pets may get nervous Jul 22 2021 According to my understanding lightning happens because the clouds get charged due to friction from the moving clouds and the ground gets polarized by the nearby charged clouds. And the two opposite Jul 24 2017 we know that the thunder can produce electricity

I was wondering whether this electricity will be AC or DC.
