Jul 21 2016 Once that happens code will resume execution at the catch

If there isabreakpoint withinafunction that s evaluated as part ofa when that breakpoint will suspend execution before any stack unwinding occurs by contrast abreakpoint ata catch will only suspend execution after all finally handlers have run 22 If there isahierarchy of exceptions you can use the base classto catchall subclasses of exceptions

In the degenerate case you cancatchall Java exceptions with If you re throw an exception within thecatchblock and that exception is caught inside of anothercatchblock everything executes accordingtothe documentation May 18 2010 Finally andcatchblocks are quite different Within thecatchblock you can respondtothe thrown exception

This block is executed only if there is an unhandled exception and the type matches the one or is subclass of the one specified in thecatchblock s parameter

Finally will be always executed after try andcatchblocks whether there is an exception raised or not 19 Cleaner code using async await with Promisecatchhandler. From what I see this has beenalong standing problem that has bugged both meanings many programmers and their code

The Promise .catchis really no different from try catch. ES6 Promise scatchhandler and work harmoniously with await async providingaproper solution and Oct 21 2013 Try Catchwillcatchan exception and allow youtohandle it and perhaps handling it meanstostop execution but it won t do that implicitly

It will actually consume the exception unless you rethrow it Nope or is s friend and always there as part of try catch. However it is perfectly validtohave them empty like in your example

In the comments in your example code If func1 throws error try func2 it would seem that what you really wanttodo is call the next function inside of the block of the previous Will Try Catchcapture all errors that ERROR can? In the following code fragment is it worthwhiletocheck for ERROR? Will RETURN 1111 ever occur? SET XACT_ABORT ON BEGIN TRANSACTION BEGIN Catchwill only run if an exception is thrown and thecatchblock can handle that type of exception

The finally block is the one that will run when the try block is complete 37 You don t needtocover every block with try catches becauseatry catchcan stillcatchunhandled exceptions thrown in functions further down the call stack

So rather than have every function haveatry catch you can have one at the top level logic of your application.
