The environment variable `USERNAME` is defined in the registry key `HKEY_CURRENT_USER\Volatile Environment`

Note however that as the keyname implies the variables in this key are volatile meaning that while the user can change them they will not retain their new values and will be overwritten by the system with derived values sort of like registry RAM

The `username` environment variable is Ways to Change User Name of Account in Windows 10. There are 6 different ways to complete this as indicated in the Windows 10 Change User Name of Account in Windows 10 post but I will reference one of those that should work well for all versions of Windows 10 whether Home Pro Enterprise etc

but see that post for other ways to do this. To Change Name of a Local Account in `netplwiz` Press the Sep 27 2020 Trying to remote desktop into my work laptop. It's a work account. I can get the login screen but there is no `username` password combination that it'll accept

What hoops are required for Remote De Mar 10 2025 When I use `Get Credential` or `Start Process Cred` a pop up asking for credentials appears meaning `username` and `password`. You can even prefill the `username` by passing it as argument

Sometimes how Apr 18 2024 0 What's the simplest way for a user to find out what their `username` is in Active Directory with the case capital or lower case letters exactly as it's canonically stored in AD in Windows 10 11? For instance for somebody with the `username` `HarveyHope` getting exactly that string and not `harveyhope` or the same letters in some other case? Oct 30 2023 The `username` is only truncated if you are linked to a Microsoft Account

So the easy solution to this problem is to unlink the Microsoft Account when prompted for `username` enter the full `username` you wish to use. Once you logout of the profile and log back into the profile the user's profile directory will reflect the name you entered in the prompt

At that point you can link the user to Jan 14 2016 Next I used the `localusername` associate with the Microsoft account on the remote machine with the new password I created on the remote machine and it worked

So ultimately the login information that worked was User Name {`localusername` of Microsoft account on remote computer} and Password {most recent Microsoft account password.} I'm a Windows 7 user I used to change the `username` from the control panel

But I would like to know how to change it using the CLI not the GUI I have
