Present day climate change includes both global warming the ongoing increase in global average temperature and its wider effects on Earth's climate system. Climate change in a broader sense also includes previous long term changes to Earth's climate

The modern day rise in global temperatures is driven by human activities especially fossil fuel coal oil and natural gas burning since Nov 24 2025. Modern global warming is the result of an increase in magnitude of the so called greenhouse effect warming of Earth's surface and lower atmosphere caused by the presence of water vapour carbon dioxide methane nitrous oxides and other greenhouse gases Jun 3 2010. Global warming is the unusually rapid increase in Earth's average surface temperature over the past century primarily due to the greenhouse gases released as people burn fossil fuels Nov 18 2025. We often think about human induced climate change as something that will happen in the future but it is happening now

Ecosystems and people in the United States and around the world are affected by the ongoing process of climate change today. Climate change has accelerated the rate of ice loss across the continent. The greenhouse effect is the warming that happens when certain gases in Earth's atmosphere trap heat

These gases let Dec 5 2025. The earth's climate is changing. Multiple lines of evidence show changes in our weather oceans ecosystems and more

The buildup of greenhouse gases in our atmosphere and the warming of the planet are responsible for changes Dec 15 2025. The severity of global warming has long depended on your frame of reference on what temperature you think was normal for the Earth before humans began changing it May 29 2025. Human activities principally through emissions of greenhouse gases have unequivocally caused global warming with global surface temperature reaching 1.1C above 1850 1900 in 2011 2020 Apr 8 2025. People often use the terms global warming and climate change interchangeably but they are different

Global warming refers to Earth's rising average temperature while climate change refers to changes in weather patterns and growing seasons around the world Jul 6 2023. What is global warming? Global warming causes effects extreme weather facts and relation to climate change.
