GDBhas a list of directories to search forsourcefiles this is called
thesourcepath

Each timeGDBwants asourcefile it tries all the directories in the list in the
order they are present in the list until it finds afilewith the desired name
GDBhas a list of directories to search forsourcefiles this is called
thesourcepath

Each timeGDBwants asourcefile it tries all the directories in the list in the
order they are present in the list until it finds afilewith the desired name

Note that the executable search path is not used for this purpose Specifies the
line of the open brace that begins the body of the function function in
thefilefilename

You only need thefilename with a function name to avoid ambiguity when there are
identically named functions in differentsourcefiles Apr 30 2017
ConclusionGDBuses debug info stored in DWARF format to findsourcelevel info

DWARF is pretty straightforward format basically its a tree of DIEs Debug Info
Entries that describes objectfiles of your programs along with variables and
functions If I there will be a lot suchfiles adding the whole path for
eachfileis like putting all thefilesin one debug directory

In other words if you havefiles with the same names but different directories
during the compilation time adding the whole paths will cause name conflicts
gdbwill not distinguish between thisfiles ExaminingSourceFilesGDBcan print parts
of your program ssource since thedebugginginformation recorded in the program
tellsGDBwhatsourcefiles were used to build it

When your program stops GDBspontaneously prints the line where it stopped Jan 20
2025 This minor setup change can save you significant time and avoid potential
frustrations associated with failing to locate thesourcefiles during a debugging
session Specifying sourcedirectories Executable programs sometimes do not record
the directories of thesourcefiles from which they were compiled just the names

Even when they do the directories could be moved between the compilation and
your debugging session.GDBhas a list of directories to search forsourcefiles
this is called thesourcepath.
